

Scan and convert Books to spoken words. Listen as you scan or save to audio files for use on PC or MP3 Players

- The ST BookReader Center puts together a complete collection scanning solution for libraries that allows users to hear books read to them. It comes with a purpose-built pc and touch screen monitor. It features highly accurate OCR (Optical Character Recognition) and auto document orientation. This combination guarantees correct output for TTS (Text To Speech). You only need to press one button, and the ST Book Reader will convert printed text into high quality speech with a lifelike voice.
- The BookReader comes with OCR and text-to-speech (TTS) software. Both of them allow the scanner to copy and read the documents scanned.
- To use these features, the user simply places a book or document on the scanning platen and, with the touch of one button, the book is scanned for one's reading pleasure. With a single touch, the Book Reader transforms printed words into audio output which can be listened to during the scanning session, or saved in MP3 format for archiving and later access.
- Embedded OCR guarantees accurate scan results and allows the software to rotate disoriented text to generate a clearer message for the user. The unit comes with patented SEE Technology which uses a curved lamp to provide a clear scan of the book without distortion along the spine of big, bulky books.
